# Hyaluronate Injections 玻尿酸注射(英文)

Hyaluronic acid is a polysaccharide, mostly injected in the dermis wrinkles or in areas that should be raised, such as : the lips, cheeks, nose, scars; it can now reduce wrinkles and has the effect of improving facial complexion. Through the usage of biotechnology extraction, the body can absorb its own hyaluronic acid, and it will degrade over time without any scars.

#### Areas of Injection

Hyaluronic acid can improve the static main lines, such as the tears trough, nasolabial folds, sunken temples, sunken cheeks, depressed scars, deep forehead wrinkles, deep frown lines, nose, chin modification, fine lines around the eyes, lip reconstruction, and face sculpture.

### Risks

Apart from the skin rush, allergy, and itchiness from the application of analgesia medicine, common contact dermatitis includes the following:

- 1. Temporary red and swollen skin after therapy, or the skin bruise caused by injection
- 2. Hyaluronate could result in partial lumps, minor pain, swelling, allergy, and granulation.

3. Patients using aspirin or anticoagulants are suggested to suspend medication for 3 days before injection to avoid apparent bruise.

(Note: : Different body or condition bears different risk and patients are obliged to inform the physician of your complete medical condition)

#### Precautions

1. Patients may experience symptoms such as swelling, red, pain, and ecchymoma after treatment injection. These symptoms usually will automatically be reduced in 1~2 weeks after the injection.

2. Do not wear makeup and drink on the day of injection and do not use sauna and infrared sauna in 1 week before injection.

3. Patients will need to be traced in 5-7 days after injection and may require additional injection in 1 week, depending on the condition.

4. Patients may feel lumps on the area receiving injection treatment and is considered normal. Please do not massage the injection area after treatment.
